

## Flair Interiors Introduces New Heated Mat for RVs

FLAIR INTERIORS, November 30, 2001. Flair Interiors Inc. of Goshen, Indiana, recently announced the introduction of a new heated mat for all types of recreational vehicles. Using electro-conductive threads specifically designed for transferring heat, Flair sees this technology as bringing warmth to a myriad of RV applications.

Thermosoft International based in Buffalo Grove, Ill. developed this technology, trademarked as FiberThermics. "FiberThermics brings warmth and safety to RV mats and furniture," said Rob Swihart, president of Flair Interiors. "There are no metal wires, and the heating threads are virtually unnoticed by the consumer."

At the recent RVIA show in Louisville, Ky., Flair demonstrated the FiberThermics technology in several travel trailer and fifth-wheel units. The FiberThermics product is designed for safety achieved through textile weaving or laminating processes, incorporates a thermal cut-off, (T.C.O.) and a feature called temperature self-limiting or T.S.L., when conditions call for automatic limiting in resistance and temperature.

Flair Interiors is based in Goshen Indiana and provides interior furniture products for a wide variety of RV applications. For more information, contact Flair Interiors at [www.flairinteriors.com](http://www.flairinteriors.com).

Thermosoft International is headquartered in Buffalo Grove, Ill., and was founded in 1996. More information about Thermosoft International can be found at [www.thermosoftinternational.com](http://www.thermosoftinternational.com).
